coming years, but if you do nothing then by the time you feel the ill health effects it will be too late.

WHAT IS DUST?

Dust can simply be described as particles in the air.

2000 Safety Guidance

Dangers of Dust

What dust consists of is purely down to what material is being cut, sanded or drilled as the physical action of your tools

breaks off small parts of the material into the atmosphere.

The harm that it can do to you depends on what the material is, don't fall into the misconception that all dust does the

same thing. Specific materials which can do particular harm to you are

wood, concrete and stone, but other materials have similar

potential to harm you and the people around you. You may well have heard of the terms inhalable and

respirable dust before. This is simply a reference to how fine the dust you are breathing in is.

Different materials can affect you in different ways. In the same way the size of the dust can have different effects.

effort has been made by HAE/EHA to ensure that the information given in this docu is accurate and not misleading. HAE/EHA cannot accept responsibility for any to have arisen from the use of any such document/material. Only Acts of Parliament ent and Statutory Instruments

have the force of law and only the courts can authoritatively interpret the law.

out of the tool.

Materials such as wood do not suit the

use of water to suppress dusts so you

must consider alternatives. Capturing

the dust as it is released from the

material being worked on is the only

alternative to water suppression, but this

When purchasing or hiring your tools,

consider whether it has the facility to

extract dust 'on the tool', as this is the

only way you can effectively capture the

dusts as they are released. Some tools

are fitted with dust bags, but these have

only limited efficiency as there is no

mechanism to actively suck the dusts

Always try to use a means that will

remove the dust by suction.

CAPTURE

PROTECT

levels of protection.

Even the best control measures aren't

going to prevent all dust being released,

and it is for this reason that respiratory

protective equipment must also be used.

Dust masks are graded in three levels -

P1, P2, and P3. You should always wear

a P3 mask as only these offer the right

Even these aren't infallible so make sure

you carry out a face fit test so you can

create a tight seal against the face.

Beards and stubble simply lift the mask

off the face meaning dust can still get

round the mask so be aware of this.
